Container()

The Container is a parent Widget that can contain multiple child widgets and manage them efficiently through width, height, padding, background color etc.

Row()

The Row widget is a layout container that you can use to position and organize content side by side in an aligned row on a page.

Column()

Column creates a vertical array of Children. It is used to organise content going down by down.

SafeArea()

It ensures that all the contents in the app is in perfect position to avoid the notch area or punch hole area in some devices

Center()

It ensures that all the contents in the app is present in center of the app.

Card()

The functionality of this widget on screen is, it is bland space or panel with round corners and a slight elevation on the lower side

Listview()

ListView is a very important widget in flutter. It is used to create the list of children

Image()

A widget that displays an image in container or card or background image etc. To insert the image, first you have to set the image location in pubspec.yaml
